

A company wants to calculate an employee's gross salary by adding the basic salary, HRA, and bonus
Write c++ pseudo code to calculate and display

BEGIN

DECLARE basicSalary, HRA, bonus, grossSalary

INPUT basicSalary

INPUT HRA

INPUT bonus

grossSalary = basicSalary + HRA + bonus

OUTPUT "BasicSalary + HRA

2. A Company wants to calculate an employee's gross Salary by adding the basic salary, HRA, and bonus
Write C++ pseudo code to calculate and display

BEGIN

DECLARE basicSalary, HRA, bonus, grossSalary AS FLOAT

INPUT basicSalary

INPUT HRA

INPUT bonus

grossSalary = basicSalary + HRA + bonus

OUTPUT "Basic Salary: ", basicSalary

OUTPUT "HRA: ", HRA

OUTPUT "Bonus: ", bonus

OUTPUT "Gross Salary: ", grossSalary

END

3. A factory records the daily production of N machines. Write C++ pseudo code to calculate the total production using a loop.

BEGIN

DECLARE N, i AS INTEGER

DECLARE production, totalProduction AS FLOAT

INPUT N

totalProduction = 0

FOR $i = 1$ TO N DO

 OUTPUT "Enter production for Machine ", i , ": "

 INPUT production

 totalProduction = totalProduction + production

END FOR

OUTPUT "Total production of ", N , " machines = "

total production

END

4 An online shopping application calculates the total amount using quantity, price, discount, and GST write c++ pseudo code to demonstrate an operator

BEGIN

DECLARE quantity AS INTEGER

DECLARE price, discount, GST, Subtotal, finalAmount AS

DECLARE gstRate AS FLOAT FLOAT

INPUT quantity

INPUT price

INPUT discount

INPUT gstRate

Subtotal = quantity * price

Subtotal = Subtotal - discount

GST = Subtotal * (gstRate / 100)

finalAmount = Subtotal + GST

OUTPUT " Subtotal after discount:", Subtotal

OUTPUT " GST @ ", gstRate, "% : ", GST

OUTPUT " Final Bill Amount : ", finalAmount

END

5. Write pseudo code for a sensor that records a temperature values as a floating point number. Convert it into an integer value for storage using explicit type casting.

BEGIN

DECLARE temperatureFloat AS FLOAT

DECLARE temperatureInt AS INTEGER

OUTPUT "Enter temperature reading from sensor:"

INPUT temperatureFloat

temperatureInt = (INTEGER) temperatureFloat

OUTPUT "original temperature:", temperatureFloat

OUTPUT "Stored temperature after casting:",

temperatureInt

END
